

"If you build an AI project, what problem will you solve and how?"

I have already done one of my capstone project in data analysis named "Employee Earning Analysis". I used Data Analytics tools only . My project future implementation is add AI features so I build it as my AI Project. I would focus on solving pay inequality and improving salary decision-making. Based on my employee earning analysis, I would develop a machine learning model that analyzes factors like experience, job role, and education to predict fair salaries. The system would also detect bias in compensation and provide insights through dashboards, helping organizations make transparent and data-driven HR decisions.
